

Security concerns?

Intruders an issue?

You can now use **PRIOR WARNING** as a defence against trespass onto your property:

# The Wall Top Alarm

The Wall Top Alarm is an **effective and proven** method of deterring burglars before they can even get close enough to enter your property.

In addition to internal and external audio alarms the *multi-recipient*, telephone based pre-warning feature of the Wall Top Alarm system has delivered peace of mind to our clients ...whether they are at home **or** away.

The most important things in your life deserve the very best protection you can give.

You now have a genuine opportunity to use all (or part) of your perimeter wall as a **superior, modern defence mechanism** against today's primary source of property theft - **the opportunist burglar.**

Become aware of an attempted burglary *before* intruders damage and *then* enter your property.

**You don't have to wait until they get this close any longer...**

We have all seen it on the news: **‘Brave resident confronts armed raiders in own home’**.

The reality is, however that the Police do not encourage anyone to ‘have a go’. It appears that the risks are too great. Many have found to their cost that a confrontation inside their home with an intruder (or intruders) is a life-changing experience.

What would **you** do if you heard a burglar downstairs during the night? *How would you react?*

Would you hurry down to confront the intruder or would you stay put and hope that they didn’t come upstairs?

Sadly, many people have already experienced the above scenario. Thankfully it is now possible to receive **PRIOR WARNING** of an attempt to break into your property. Should anyone attempt to scale your perimeter wall you (and several of your nominated contacts) will be informed immediately. *How?*

*Prior warning* of an illegal attempt to enter your property has now been made possible through the combination of the latest innovations in communication technology and our world-first, award-winning product to create:

## ‘The Wall Top Alarm’

**How does it work?** Well, in order to learn how The Wall Top Alarm is so effective we need to look at why so many burglaries occur. Many burglaries are opportunistic. This means that intruders’ will make the most of an opportunity that presents itself in the form of **a)** ease of access, **b)** anonymity once on the property and **c)** a vulnerable window or door.

Once out of sight an intruder will force entry, sometimes ransacking the target property in search of valuables, or oftentimes snatching the nearest items to hand. A quick exit usually ensues, in most cases leaving behind mayhem in terms of damage to furniture, décor and the site of access into the property. The emotional turmoil created when discovering the burglary cannot be quantified and the upsetting inconvenience of repairs to the site of the break-in can be very costly indeed.

Acknowledging that at the heart of most burglaries lies a perceived ‘opportunity’ we have developed an innovative and effective response. Positioning a Wall Top Alarm along the perimeter of your property removes the opportunity for a potential burglar. **How?**

The Wall Top Alarm is a simple, but extremely effective solution. We have ‘turned the table’ on the burglar. Our system offers you the opportunity to alert the burglar(s) that you are aware of their presence ...long before they are close enough to your property to damage it - **let alone enter it.**

With existing home/commercial alarms any property intrusion is only detected *after* the intruder has damaged and broken through a door or window **and is already inside the property.**

The reason why the Wall Top Alarm is so effective lies within the basic instinct of each burglar, which is to *avoid capture*. Clearly, providing prior notification of an intent to force entry into any property is definitely not compatible with avoiding capture!

The act of seizing an opportunity to enter your property by climbing your perimeter wall will result in the instant activation of the alarm ..and a simultaneous notification to you that an incident is taking place. *It is at precisely this moment that the burglar becomes aware they have already been detected.*

Amazingly, as the property owner/occupier you can now be notified - **by the intruder** - of their criminal intentions before they have even begun to cross your garden!

**Imagine you are the intruder:**

You have decided to break-in. You have also discovered the most appropriate place to get onto the target property without being disturbed.

One final check that you have not been seen, then up you go as you pull yourself onto the top of the wall.

**Suddenly, the house alarm sounds! Sirens are alerting the occupants that you are there!**

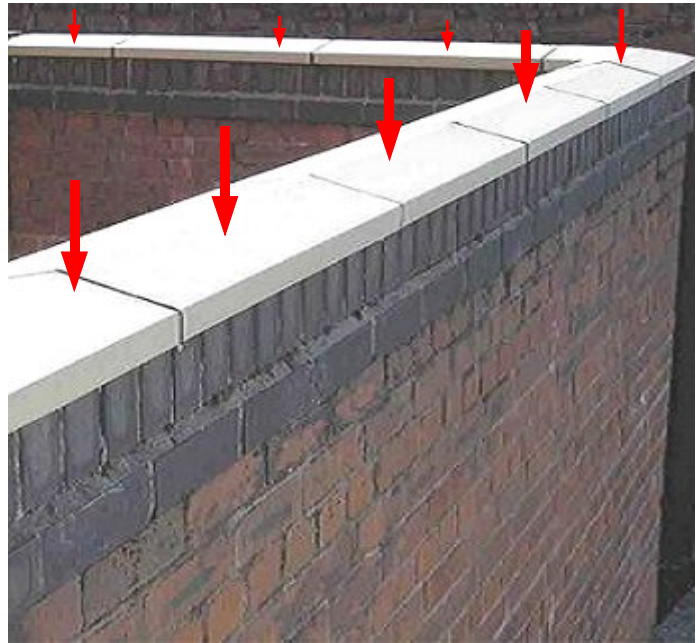

**How can that be???**

You haven't got near enough to the house to set off the alarm, yet neighbours (who have already been notified of your actions via automated, instant mobile message alerts) are already looking out of their window in your direction...

**...and you haven't even finished climbing over the wall yet!**

If you were the intruder (recognising that you have yet to force entry into the property), what would **YOU** do next? Would you continue over the wall ..or would you make a hasty (empty handed) exit?

The above image shows a typical Wall Top Alarm installation. The top 'coping stones' form an integral part of the system. Climbing over these walls will result in downward and/or sideways pressure on the coping stones, activating the internal/external house alarm. Instant telephone message alerts are then automatically sent to the client and each of their designated recipients.

Please call us to learn of instances where the Wall Top Alarm has prevented burglaries **and** prevented the very real likelihood of confrontation with an intruder.

Planned or existing new-build projects could benefit from significantly increased levels of security through the use of the Wall Top Alarm, as the system offers excellent opportunities to **design out crime**.

We can help you plan to ensure that intruders are detected as they come into contact with the perimeter of your newly-built property.

Additional options include instantly activated security lights and CCTV, with potential connectivity to the Internet depending upon existing back-up systems.

As mentioned above each additional selected option will be programmed to activate even before the intruder has climbed over your perimeter wall.

**Possessing the ability to use your perimeter wall to generate an efficient non-harming, proactive defence of your home is quite unique in today's security industry ...why not give us a call today to arrange your free consultation?**

Of the alternative products available to protect your property, none provide the ultimate combination of prior notification, efficiency, safety and *aesthetic desirability*.

Would you **really** consider using any of the following products on *your* property?

- **Shards of broken glass** which are, by definition inherently dangerous.
- **Barbed wire** is also dangerous and unsightly.
- Similarly, the variety of **spikes** and **rolling spikes** on the market can inflict injury to humans, birds and animals.
- **Seismic sensors** are effective, but along with **electric fences** these are highly prone to false alarms. Sensors are also prone to disturbance by passing traffic - even airplanes - and electric fences aren't always recognised as such by children and are therefore potentially dangerous (hence the restricted use of these in most domestic and commercial applications).
- Although less detrimental to the external appearance of the surrounding area, perimeter alarm systems incorporating **electronic beams** are equally prone to false alarms created by either humans, animals, birds or insects.
- Monitored **CCTV** perimeter alarm security is very expensive, requiring high levels of maintenance and manpower.
- **Anti-scaling paint or grease** is a less expensive perimeter protection product, but bypassing it is relatively easy (e.g. through the use of a thick material such as carpet or heavy cloth). Also, as with barbed wire and spikes etc. inappropriate use of anti-scaling paint/grease could result in litigation should anyone slip on the paint and suffer injury (or even soil their clothing).

### The Wall Top Alarm

The internationally patented **Wall Top Alarm**:

- **is always active 24/7** - with no need to set/reset daily;
- is extremely **low maintenance**;
- can be installed on **existing or new perimeters**;
- is **not dangerous**;
- is **reliable** - the potential for false alarms has been designed out (i.e. the system will take the weight of a cat or fox etc. but not the weight of a child and will withstand snow loads and high winds);
- is an **aesthetically pleasing** addition to any built environment;
- is **adaptable** to the needs of each client;  
...and
- can be **safely** used on exclusive, high-end properties.
